

Problem 1 (Uniqueness by energy methods, 4 points).

Show that there is at most one smooth solution $u(x, t)$ to the equation

$$u_{tt} + cu_t - u_{xx} = f \quad (x, t) \in (0, 1) \times (0, \infty),$$

$c \in \mathbb{R}$, with initial conditions $u(x, 0) = g(x)$, $u_t(x, 0) = h(x)$, and boundary conditions $u(0, t) = u(1, t) = 0$.

Hint: study the function $E(t) := \frac{1}{2} \int_0^1 (u_t^2(x, t) + u_x^2(x, t)) dx$ (you may distinguish the cases $c \geq 0$ and $c < 0$).

Problem 2 (Picone's example, 4 points).

Let $u \in C^1(\overline{\Omega})$ be a solution to

$$a(x, y)u_x + b(x, y)u_y = -u,$$

where $\Omega = B_1(0)$ is the unit ball in \mathbb{R}^2 . Assume that $a, b \in C^\infty(\mathbb{R}^2)$ and $a(x, y)x + b(x, y)y > 0$ on $\partial\Omega$. Prove that u vanishes identically in Ω .

Hint: show that $\max_{\overline{\Omega}} u \leq 0$, $\min_{\overline{\Omega}} u \geq 0$.

Problem 3 (Viscous Burgers' equation, 4 points).

Consider the viscous Burgers' equation

$$u_t + uu_x = \nu u_{xx},$$

with $\nu \in \mathbb{R}$.

- a) Identify the exponents n, m such that self-similar solutions of the form $u(x, t) = t^m f(xt^n)$ can be obtained. Write down the resulting ODE for the function f .
- b) Let $s(x, t)$ be a solution to the heat equation $s_t = \nu s_{xx}$. Show that, if we make the transformation $u(x, t) = -2\nu s_x/s$, we obtain a solution to the viscous Burgers' equation.

Problem 4 (Korteweg-de Vries equation, 4 points).

Consider the Korteweg-de Vries equation

$$u_t + 6uu_x + u_{xxx} = 0.$$

We look for a traveling wave solution $u(x, t) = f(x - ct)$. Write the resulting ODE for f . Assuming that both f and its derivatives vanish at infinity, integrate this equation once to get a second order ODE for f .
